Machine Learning Lecture 1: intro to ML

Radoslav Neychev

MIPT, fall 2023

Outline

- 1. ML and AI overview
- 2. Thesaurus and notation
- 3. Maximum Likelihood Estimation
- 4. Some Machine Learning problems
 - a. Classification
 - b. Regression
 - c. Dimensionality reduction
- 5. Naïve Bayes classifier
- 6. k Nearest Neighbours (kNN)

ML and Al overview

girafe ai

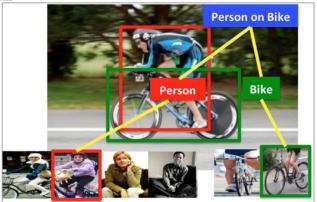

Machine Learning applications

- Object detection
- Action classification
- Image captioning
- •

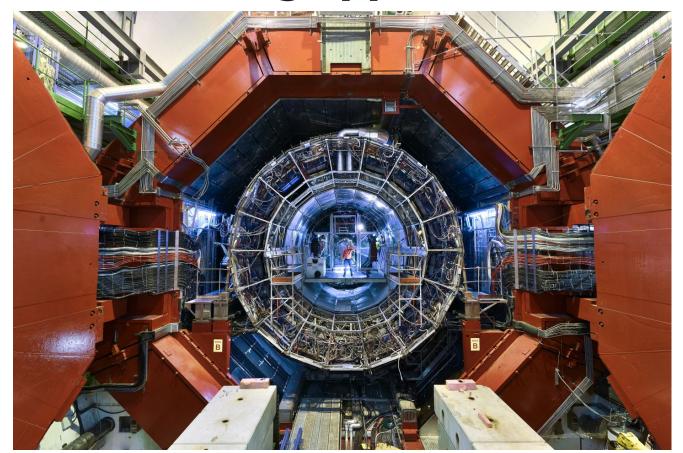

Machine Learning applications

Machine Learning applications

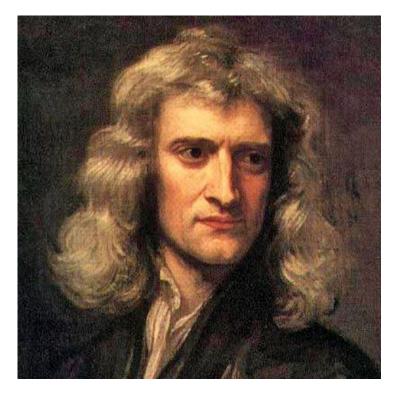

Data Knowledge

Long before the ML

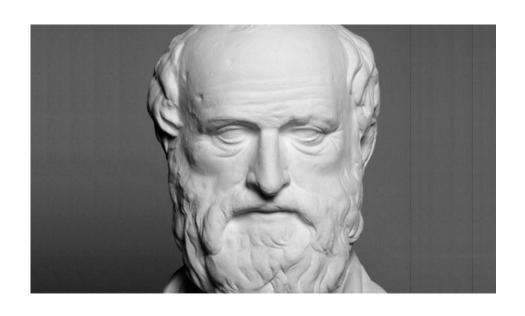

Isaac Newton

Johannes Kepler

Long before the ML

Eratosthenes

girafe

Denote the **dataset**.

,	<u>, </u>							
/			Statistics	Python		Native	Target	Target
\	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(passed)
	John	22	5	4	Brown	English	5	TRUE
1	Aahna	17	4	5	Brown	Hindi	4	TRUE
	Emily	25	5	5	Blue	Chinese	5	TRUE
	Michael	27	3	4	Green	French	5	TRUE
	Some							
	student	23	3	3	NA	Esperanto	2	FALSE

Observation (or datum, or data point) is one piece of information.

,		-			•			
\langle			Statistics	Python		Native	Target	Target
	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(passed)
	John	22	5	4	Brown	English	5	TRUE
1	Aahna	17	4	5	Brown	Hindi	4	TRUE
	Emily	25	5	5	Blue	Chinese	5	TRUE
	Michael	27	3	4	Green	French	5	TRUE
	Some							
X	student	23	3	3	NA	Esperanto	2	FALSE

In many cases the observations are supposed to be *i.i.d.*

- independent
- identically distributed

Feature (or predictor) represents some special property.

	Name	Age	Statistics (mark)	Python (mark)	Eye color	Native language	Target (mark)	Target (passed)

	Michael	27	3	4	Green	French	5	TRUE
	Some							
	student	23	3	3	NA	Esperanto	2	FALSE

And even the name is a **feature**

,	<u>, </u>							
$\sqrt{}$			Statistics	Python		Native	Target	Target
\	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(passed)
	John	22	5	4	Brown	English	5	TRUE
1	Aahna	17	4	5	Brown	Hindi	4	TRUE
	Emily	25	5	5	Blue	Chinese	5	TRUE
	Michael	27	3	4	Green	French	5	TRUE
	Some							
	student	23	3	3	NA	Esperanto	2	FALSE

The **design matrix** contains all the features and observations.

,	<u>, </u>							
/			Statistics	Python		Native	Target	Target
	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(passed)
	John	22	5	4	Brown	English	5	TRUE
1	Aahna	17	4	5	Brown	Hindi	4	TRUE
	Emily	25	5	5	Blue	Chinese	5	TRUE
	Michael	27	3	4	Green	French	5	TRUE
	Some							
X	student	23	3	3	NA	Esperanto	2	FALSE

Features can even be multidimensional, we will discuss it later in this course.

Target represents the information we are interested in.

/	•							
\langle			Statistics	Python		Native	Target	Target
\	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(passed)
	John	22	5	4	Brown	English	5	TRUE
1	Aahna	17	4	5	Brown	Hindi	4	TRUE
· ·	Emily	25	5	5	Blue	Chinese	5	TRUE
	Michael	27	3	4	Green	French	5	TRUE
	Some							
Y	student	23	3	3	NA	Esperanto	2	FALSE

Target can be either a **number** (real, integer, etc.) – for **regression** problem

Target represents the information we are interested in.

		Statistics	Python		Native	Target	Target
Name	Age	(mark)	(mark)	Eye color	language	(mark)	(passed)
John	22	5	4	Brown	English	5	TRUE
Aahna	17	4	5	Brown	Hindi	4	TRUE
Emily	25	5	5	Blue	Chinese	5	TRUE
 Michael	27	3	4	Green	French	5	TRUE
Some							
student	23	3	3	NA	Esperanto	2	FALSE

Or a **label** – for **classification** problem

Target represents the information we are interested in.

/								
\langle			Statistics	Python		Native	Target	Target
	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(passed)
	John	22	5	4	Brown	English	5	TRUE
1	Aahna	17	4	5	Brown	Hindi	4	TRUE
	Emily	25	5	5	Blue	Chinese	5	TRUE
	Michael	27	3	4	Green	French	5	TRUE
	Some							
Y	student	23	3	3	NA	Esperanto	2	FALSE

Mark can be treated as a label too (due to finite number of labels: 1 to 5). We will discuss it later.

Further we will work with the numerical target (mark)

Name	Age	Statistics (mark)	Python (mark)	Eye color	Native language	Target (mark)
John	22	,	,	Brown	English	5
Aahna	17	4	5	Brown	Hindi	4
Emily	25	5	5	Blue	Chinese	5
Michael	27	3	4	Green	French	5
Some						
student	23	3	3	NA	Esperanto	2

The **prediction** contains values we predicted using some **model**.

\langle			Statistics	Python		Native	Target	Predicted
	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(mark)
	John	22	5	4	Brown	English	5	4.5
1	Aahna	17	4	5	Brown	Hindi	4	4.5
	Emily	25	5	5	Blue	Chinese	5	5
	Michael	27	3	4	Green	French	5	3.5
	Some							
7	student	23	3	3	NA	Esperanto	2	3

One could notice that prediction just averages of Statistics and Python marks. So our **model** can be represented as follows:

The **prediction** contains values we predicted using some **model**.

\langle			Statistics	Python		Native	Target	Predicted
	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(mark)
	John	22	5	4	Brown	English	5	4.5
/	Aahna	17	4	5	Brown	Hindi	4	4.5
	Emily	25	5	5	Blue	Chinese	5	5
	Michael	27	3	4	Green	French	5	3.5
	Some							
	student	23	3	3	NA	Esperanto	2	3

Different models can provide different predictions:

The **prediction** contains values we predicted using some **model**.

			Statistics	Python		Native	Target	Predicted
	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(mark)
	John	22	5	4	Brown	English	5	1
	Aahna	17	4	5	Brown	Hindi	4	5
	Emily	25	5	5	Blue	Chinese	5	2
	Michael	27	3	4	Green	French	5	4
	Some							
1	student	23	3	3	NA	Esperanto	2	3

Different models can provide different predictions:

$$\operatorname{mark}_{ML} = \operatorname{random}(\operatorname{integer from} [1; 5])$$

The **prediction** contains values we predicted using some **model**.

			Statistics	Python	_	Native	Target	Predicted
	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(mark)
	John	22	5	4	Brown	English	5	1
	Aahna	17	4	5	Brown	Hindi	4	5
	Emily	25	5	5	Blue	Chinese	5	2
_	Michael	27	3	4	Green	French	5	4
	Some							
1	student	23	3	3	NA	Esperanto	2	3

Different models can provide different predictions.

Usually some hypothesis lies beneath the model choice.

Loss function measures the error rate of our model.

Square	Target	Predicted
deviation	Target (mark)	(mark)
16	5	1
1	4	5
9	5	2
1	5	4
1	2	3

• **Mean Squared Error** (where **y** is vector of targets):

$$MSE(\mathbf{y}, \hat{\mathbf{y}}) = \frac{1}{N} ||\mathbf{y} - \hat{\mathbf{y}}||_2^2 = \frac{1}{N} \sum_i (y_i - \hat{y}_i)^2$$

Loss function measures the error rate of our model.

Absolute deviation	Target (mark)	Predicted (mark)
4	5	1
1	4	5
3	5	2
1	5	4
1	2	3

• **Mean Absolute Error** (where **y** is vector of targets):

$$MAE(\mathbf{y}, \hat{\mathbf{y}}) = \frac{1}{N} ||\mathbf{y} - \hat{\mathbf{y}}||_1 = \frac{1}{N} \sum_{i} |y_i - \hat{y}_i|$$

To learn something, our **model** needs some degrees of freedom:

	Name	Age	Statistics (mark)	Python (mark)	Eye color		Target (mark)	Predicted (mark)
	John	22	5	4	Brown	English	5	4.5
	Aahna	17	4	5	Brown	Hindi	4	4.5
	Emily	25	5	5	Blue	Chinese	5	5
	Michael	27	3	4	Green	French	5	3.5
	Some							
1	student	23	3	3	NA	Esperanto	2	3

$$\operatorname{mark}_{ML} = w_1 \cdot \operatorname{mark}_{Statistics} + w_2 \cdot \operatorname{mark}_{Python}$$

To learn something, our **model** needs some degrees of freedom:

			Statistics	Python		Native	Target	Predicted
	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(mark)
	John	22	5	4	Brown	English	5	4.447
	Aahna	17	4	5	Brown	Hindi	4	4.734
	Emily	25	5	5	Blue	Chinese	5	5.101
	Michael	27	3	4	Green	French	5	3.714
	Some							
1	student	23	3	3	NA	Esperanto	2	3.060

$$\operatorname{mark}_{ML} = w_1 \cdot \operatorname{mark}_{Statistics} + w_2 \cdot \operatorname{mark}_{Python}$$

To learn something, our **model** needs some degrees of freedom:

			Statistics	Python		Native	Target	Predicted
	Name	Age	(mark)	(mark)	Eye color	language	(mark)	(mark)
	John	22	5	4	Brown	English	5	1
	Aahna	17	4	5	Brown	Hindi	4	5
	Emily	25	5	5	Blue	Chinese	5	2
	Michael	27	3	4	Green	French	5	4
	Some							
1	student	23	3	3	NA	Esperanto	2	3

$$\operatorname{mark}_{ML} = \operatorname{random}(\operatorname{integer from} [1; 5])$$

Last term we should learn for now is **hyperparameter**.

Hyperparameter should be fixed before our model starts to work with the data.

We will discuss it later with kNN as an example.

Recap:

- Dataset
- Observation (datum)
- Feature
- Design matrix
- Target
- Prediction
- Model
- Loss function
- Parameter
- Hyperparameter

Maximum Likelihood Estimation

girafe

Likelihood

Denote dataset generated by distribution with parameter $\, heta$

Likelihood function:

$$L(\theta|X,Y) = P(X,Y|\theta)$$

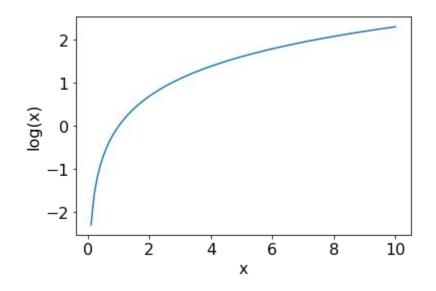

$$L(\theta|X,Y) \longrightarrow \max_{\theta}$$

$$L(\theta|X,Y) = P(X,Y|\theta) = \prod_{i} P(x_{i},y_{i}|\theta)$$

samples should be i.i.d.

Maximum Likelihood Estimation

Likelihood

$$L(\theta|X,Y) = P(X,Y|\theta)$$

$$L(\theta|X,Y) \longrightarrow \max_{\theta}$$

$$L(\theta|X,Y) = P(X,Y|\theta) = \prod_{i} P(x_i, y_i|\theta)$$

$$\log L(\theta|X,Y) = \sum_{i} \log P(x_i, y_i|\theta) \longrightarrow \max_{\theta}$$

Machine Learning problems overview

girafe

Supervised learning problem statement

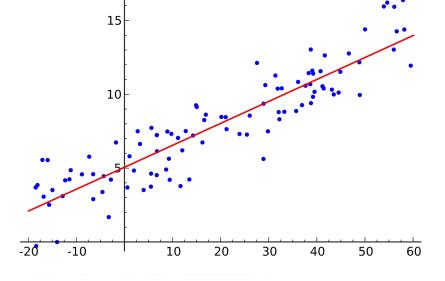

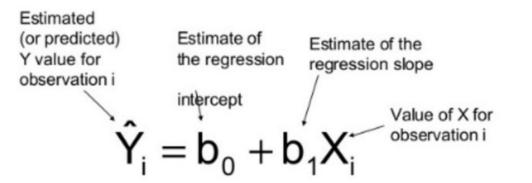

Let's denote:

- ullet Training set $\mathcal{L} = \{\mathbf{x}_i, y_i\}_{i=1}^n$, where
 - $\circ (\mathbf{x} \in \mathbb{R}^p, y \in \mathbb{R})$ for regression
 - $\mathbf{x}_i \in \mathbb{R}^p$, $y_i \in \{+1, -1\}$ for binary classification
- ullet Model $f(\mathbf{X})$ predicts some value for every object
- ullet Loss function $Q(\mathbf{x},y,f)$ that should be minimized

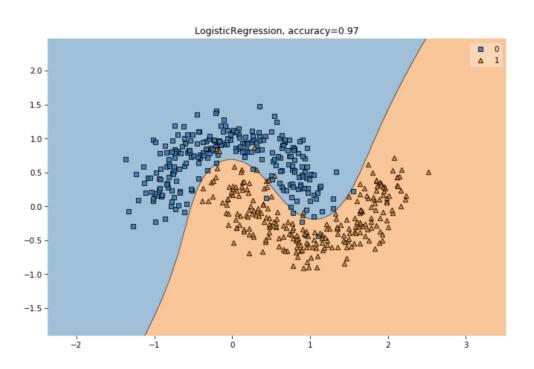

• Regression problem

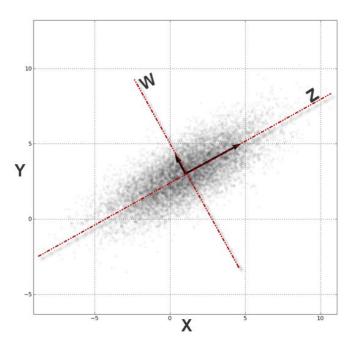

- Regression problem
- Classification problem

- Regression problem
- Classification problem
- Dimensionality reduction

girafe ai

Let's denote:

- ullet Training set $\mathcal{L} = \{\mathbf{x}_i, y_i\}_{i=1}^n$, where
 - $oldsymbol{arphi}_i \in \mathbb{R}^{p}$, $y_i \in \{C_1, \dots, C_k\}$ for k-class classification

Bayes' theorem

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)}$$

or, in our case

$$P(y_i = C_k | \mathbf{x}_i) = \frac{P(\mathbf{x}_i | y_i = C_k) P(y_i = C_k)}{P(\mathbf{x}_i)}$$

Let's denote:

- Training set $\mathcal{L} = \{\mathbf{x}_i, y_i\}_{i=1}^n$, where
 - \circ $\mathbf{x}_i \in \mathbb{R}^p$, $y_i \in \{C_1, \dots, C_K\}$ for K-class classification

$$P(y_i = C_k | \mathbf{x}_i) = \frac{P(\mathbf{x}_i | y_i = C_k) P(y_i = C_k)}{P(\mathbf{x}_i)}$$

Naïve assumption: features are **independent**

$$P(y_i = C_k | \mathbf{x}_i) = \frac{P(\mathbf{x}_i | y_i = C_k) P(y_i = C_k)}{P(\mathbf{x}_i)}$$

Naïve assumption: features are independent:

$$P(\mathbf{x}_i|y_i = C_k) = \prod_{l=1}^{r} P(x_i^l|y_i = C_k)$$

$$P(y_i = C_k | \mathbf{x}_i) = \frac{P(\mathbf{x}_i | y_i = C_k) P(y_i = C_k)}{P(\mathbf{x}_i)}$$

Optimal class label:

$$C^* = \arg\max_k P(y_i = C_k | \mathbf{x_i})$$

To find maximum we even do not need the denominator

But we need it to get probabilities

kNN – k Nearest Neighbors

girafe ai

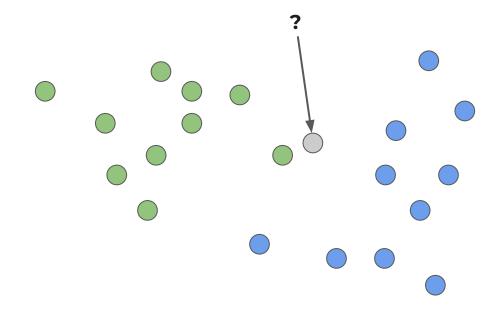

kNN - k Nearest Neighbours

kNN - k Nearest Neighbours

k Nearest Neighbors Method

Given a new observation:

- 1. Calculate the distance to each of the samples in the dataset.
- 2. Select samples from the dataset with the minimal distance to them.
- The label of the new observation will be the most frequent label among those nearest neighbors.

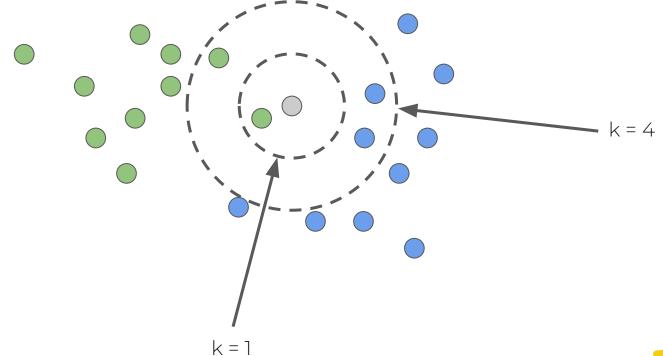

How to make it better?

• The number of neighbors k (it is a **hyperparameter**)

kNN - k Nearest Neighbours

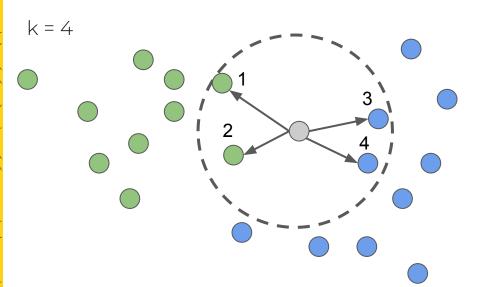

How to make it better?

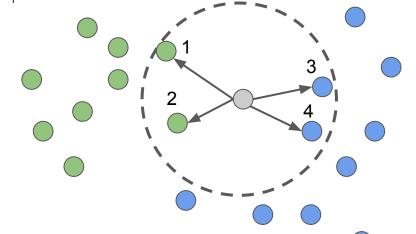

- The number of neighbors k (it is a **hyperparameter**)
- The distance measure between samples
 - a. Hamming
 - b. Euclidean
 - c. cosine
 - d. Minkowski distances
 - e. etc.
- Weighted neighbours

k = 4

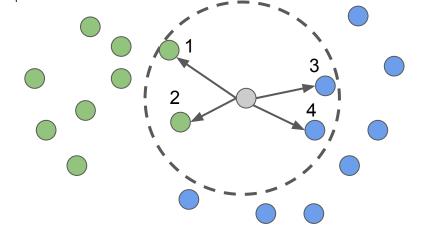

Weights can be adjusted according to the neighbors order,

$$w(\mathbf{x}_{(i)}) = w_i$$

$$k = 4$$

 Weights can be adjusted according to the neighbors order,

$$w(\mathbf{x}_{(i)}) = w_i$$

or on the distance itself

$$w(\mathbf{x}_{(i)}) = w(d(\mathbf{x}, \mathbf{x}_{(i)}))$$

 Weights can be adjusted according to the neighbors order,

$$w(\mathbf{x}_{(i)}) = w_i$$

• or on the distance itself $w(\mathbf{x}_{(i)}) = w(d(\mathbf{x}, \mathbf{x}_{(i)}))$

$$p_{\text{green}} = \frac{w(\mathbf{x}_1) + w(\mathbf{x}_2)}{w(\mathbf{x}_1) + w(\mathbf{x}_2) + w(\mathbf{x}_3) + w(\mathbf{x}_4)}$$

Weights can be adjusted according to the neighbors order,

$$w(\mathbf{x}_{(i)}) = w_i$$

 $oldsymbol{w}$ or on the distance itself $w(\mathbf{x}_{(i)}) = w(d(\mathbf{x}, \mathbf{x}_{(i)}))$

$$p_{\text{blue}} = \frac{w(\mathbf{x}_3) + w(\mathbf{x}_4)}{w(\mathbf{x}_1) + w(\mathbf{x}_2) + w(\mathbf{x}_3) + w(\mathbf{x}_4)}$$

Outro

- Remember the i.i.d. property
- Usually the first dimension corresponds to the batch size, the second (and so on) to the features/time/...
- Even the naïve assumptions may be suitable in some cases
- Simple models provide great baselines

Revise

- 1. ML and AI overview
- 2. Thesaurus and notation
- 3. Maximum Likelihood Estimation
- 4. Some Machine Learning problems
 - a. Classification
 - b. Regression
 - c. Dimensionality reduction
- 5. Naïve Bayes classifier
- 6. k Nearest Neighbours (kNN)

A&Q

Thanks for attention!
